# Auri™
Auri™ Manager Certificate Install Process

Without an appropriate Ampetronic Ltd certificate installed, attempting to run the BLEEarth MSIX will not be possible – note the 'certificate could not be verified' message and the disabled Install button in the screenshot below:

To install the certificate, follows these steps:

1. Open certmgr on Windows (search for 'manage computer certificates' in Start or Control Panel). This requires admin permissions.
2. Expand the Trusted Root Certification Authorities node and select Certificates.
3. Right-click Certificates and select All Tasks > Import...
4. On the Certificate Import Wizard window, the Store Location should be fixed to Local Machine. Click Next.
5. Click Browse... and locate the AuriManager1.3.2_x64.cer file (or equivalent for the version you wish to install). Click Next.
6. Ensure that Place all certificates in the following store is selected and set appropriately (to Trusted Root Certification Authorities). Click Next followed by Finish.

When launching the MSIX again, it should now be possible to install the application.
